Machine learning

Machine learning (ML) is a subfield of artificial intelligence.

Intuitively We want to *learn from* and *make predictions on* data.

Technically We want to update the parameters of a model to make it describe our training data as well as possible (“well” being defined by a *loss function*).

Application examples

Supervised learning

- Supervised tasks

- ▶ Regression

Recommender system

(user, book) \rightarrow rating

House price

(surface, nb rooms, city) \rightarrow price

- ▶ Classification

Image classification

pixel values \rightarrow cat or dog

Text classification

list of words \rightarrow spam or valid email

- Unsupervised tasks

- ▶ Clustering

Group clients by interests

- ▶ Anomaly detection

Detect unusual and strange events

Deep Natural Language Processing (NLP)

Main ideas

- Learning the **semantic meaning** of words,

Deep Natural Language Processing (NLP)

Main ideas

- Learning the **semantic meaning** of words,
- Understanding the **information hierarchy** related to the task at hand,

Deep Natural Language Processing (NLP)

Main ideas

- Learning the **semantic meaning** of words,
- Understanding the **information hierarchy** related to the task at hand,
- Ability to make use of **huge amounts of data**.

Word embeddings

Semantic vectors

We associate to each word of the vocabulary a vector which represents its **meaning**.

Oven $[-0.2, 0.6]$

Microwave $[-0.05, 0.57]$

Garden $[0.22, -0.5]$

In real applications word embedding have 100 to 300 dimensions

Word embeddings

Links between concepts

When word embeddings are created using a large enough dataset, a lot of information is encoded in **differences** between vectors.
